

1 Plan inside the world model

Released LeWM on PushT; CEM minimizes the predicted cost.

2 Search picks optimistic plans

optimism = realized – predicted latent cost

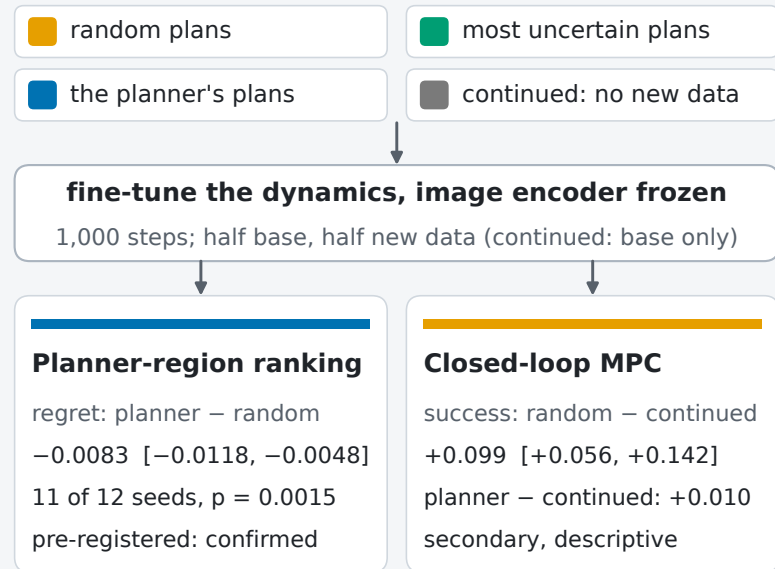

Open-loop task success of the same plans: 0.08, 0.17, 0.67; dots are the 12 seeds.

Picking the best-looking plan favours plans whose cost the model underestimates.

3 Repair with 40,000 new transitions

Fine-tune on each strategy's data, 12 seeds each, then test.

Held-out loss ranked the branches differently from both.
